

Find the signal. Move when it matters.

Intelligent revenue systems for B2B teams drowning in tools, data, and noise.

Modern GTM is loud. Revenue is quiet.

Teams added tools, data, sequences, and AI — but still struggle to answer the only question that matters:

Which accounts deserve attention right now?

STATIC LISTS

Every account looks equally important until a real buying window is missed.

TOOL SPRAWL

CRM, Apollo, LinkedIn, enrichment, email, and reporting rarely share one brain.

FAKE CONTEXT

“Saw your post” is not relevance. Buyers respond to timing and commercial need.

Pipeline starts before the reply.

A prospect usually moves before they respond: hiring, leadership change, expansion, website behavior, product usage, funding, dormant CRM activity, technology shifts, or public pain.

Sonar turns movement into commercial action.

FIT

Is this company worth pursuing?

MOVEMENT

What changed that makes timing relevant?

ACTION

Who should act, what should they say, and through which channel?

A market-sensing system with two modes.

Sonar is the intelligence layer between market movement and revenue action. It listens for signals, runs directed pulses, and learns from outcomes.

A signal-to-action system inside your existing stack.

We connect the tools you already use into one operating loop: data, signals, context, scoring, research, activation, CRM, and reporting.

SIGNAL ARCHITECTURE

ICP, segments, data sources, trigger logic, scoring model, and "why now" rules.

RESEARCH AGENTS

Company context, persona mapping, trigger interpretation, and message inputs.

ACTIVATION LAYER

Email, LinkedIn, CRM tasks, Slack alerts, rep routing, and reply handling.

LEARNING LOOP

Outcomes return to the CRM and improve prioritization over time.

From signal to action in one loop.

Example: a dormant target account hires a new CRO, visits your pricing page, and starts hiring SDRs.

The output is not “send more email.” The output is an explainable recommendation: why this account, why now, who to contact, what to say, and whether the action should be automated or human-led.

The signal matters less than the combination.

Revenue hiring

SDR, AE, RevOps, Growth, or Sales leadership roles.

Leadership change

New CRO, VP Sales, Head of Growth, or founder-led transition.

First-party activity

Website visits, content engagement, signups, product usage, or dormant CRM reactivation.

Expansion

New market, product launch, acquisition, location, or partnership.

Technology shift

New tool adoption, migration, or workflow pressure.

Public pain

Posts, communities, job descriptions, or conversations that reveal active need.

Deploy Sonar for revenue — or build a strategic system around another workflow.

DEPLOY SONAR

For revenue teams that need better timing, prioritization, and action.

Always-on listening + directed pulse campaigns + managed operation inside your existing stack.

BUILD WITH SONAR

For high-value workflows that need intelligence and action beyond GTM.

Research, proposals, onboarding, customer success, reporting, and operational coordination.

Revenue is the first focus. The system architecture is bigger than lead generation.

No token math. No agent babysitting. No infrastructure puzzle.

You buy a managed workflow with a defined scope, clear controls, and ongoing improvement.

- Infrastructure included within scope
- Monitoring and maintenance
- Human approvals where needed
- Security and access controls
- CRM and workflow integration
- Continuous optimization
- Major new workflows separately scoped

THE PRINCIPLE

Customers should feel like the system works for them — not like they are managing agents, debugging prompts, or paying unpredictable token bills.

Best fit: ambitious teams with tools, data, and pipeline pressure.

GOOD FIT

- B2B SaaS or tech-enabled services
- 20–150 employees
- \$15K+ ACV
- Existing CRM + outbound stack
- Inconsistent pipeline
- Founder or revenue leader wants sharper timing

NOT A FIT

- No clear ICP
- Very low ACV
- No sales owner
- No CRM discipline
- Wants cheap appointment-setting
- Believes more email volume fixes everything

The first question is not “how many leads?” It is “what movements actually predict revenue?”

Better timing. Cleaner focus. More qualified movement.

1

Sales attention moves toward accounts with fit + movement, not static filters.

2

Messaging becomes grounded in commercial relevance and timing.

3

The CRM becomes a learning loop for signal-to-pipeline conversion.

Success is measured through meetings created, opportunities influenced, rep time saved, dormant pipeline revived, and workflow reliability — not vanity volume.

Let's map your first signal-to-pipeline workflow.

In one working session, we identify the segment, signals, data sources, decision rules, and first activation path worth testing.

DISCOVERY OUTPUT

A clear workflow candidate, data requirements, signal logic, scope, timeline, and implementation path.

**Find the signal.
Move when it
matters.**
